Space Weather Forecast

Issued on Friday 7 March 2025 at 01:06 Local

This forecast provides a four-day assessment of space weather events. The probabilities stated below are for reaching or exceeding the given levels. For more information about space weather impacts please see the Met Office Space Weather Scales https://www.metoffice.gov.uk/weather/learn-about/space-weather/uk-scales

---

Space Weather Forecast Headline: Chance of Moderate class flares (Minor-Moderate radio blackouts) throughout. Minor/Moderate geomagnetic storm (G1/G2) likely Days 2/3.

Analysis of Space Weather Activity over past 24 hours

Solar Activity: Solar activity has been Low with occasional low level Common-class activity in the past 24 hours.

There are currently seven sunspot regions on the visible solar disc. A moderately large bi-polar group in the southeast quadrant is the most significant region and is slowly increasing but has not produced any significant flares recently. The second largest region is also in the southeast and slowly increasing. However its magnetic complexity has reduced. A region in the northwest has developed over this period. Remaining spot regions are small and magnetically simple.

No Earth-directed Coronal Mass Ejections (CMEs) were identified in available satellite imagery.

Solar Wind / Geomagnetic Activity: Solar winds were Slightly Elevated and are now at Background levels. The Interplanetary Magnetic Field was mainly Weak, and the north-south component was Weak and variable. Geomagnetic activity was Quiet (Kp 1-2), as observed by BGS.

Energetic Particles / Solar Radiation: No solar radiation storms were observed.

Four-Day Space Weather Forecast Summary

Solar Activity: Solar activity is expected to be generally Low, with a chance of isolated Moderate class flares.

Solar Wind / Geomagnetic Activity: There are currently no Earth-directed CMEs in the forecast. Background solar winds are expected during day 1 (7 March). On day 2 (8 March) the next fast wind from a coronal hole is likely to reach Earth increasing the solar wind speed to Elevated to Strong. Geomagnetic activity is expected to be Quiet to Unsettled levels on day 1. On day 2 and 3 (8/9 March), periods of Active to G1/minor geomagnetic storm are likely with a chance of isolated G2/Moderate geomagnetic storms. On day 4 (10 March), periods of Unsettled to Active are likely with a chance of G1/minor geomagnetic storm.

Energetic Particles / Solar Radiation: No solar radiation storms are expected.

Geomagnetic Storms

Geomagnetic Storm Probability (Exceedance)	Level	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Minor or Moderate	G1 to G2	No	1	60	70	50
Strong	G3	No	1	10	10	5
Severe	G4	No	1	1	1	0
Extreme	G5	No	1	1	1	0

Radio Blackouts - X-Ray Flares

X-Ray Flares Probability	Level	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Active	R1-R2 (M Class)	No	40	40	40	40
Very Active	R3-R5 (X Class)	No	5	5	5	5

Solar Radiation Storms (High Energy Protons)

Radiation Storms Probability (Exceedance)	Level ($cm^{-2}sr^{-1}s^{-1}$)	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Active	≥ S1	No	5	5	5	5
Very Active	≥ S3 *	No	1	1	1	1
* S3 ≥ 10 MeV ≥ 1000 pfu and/or 50 MeV ≥ 10pfu. (pfu = $cm^{-2}sr^{-1}s^{-1}$)
